U. S. Department of Agriculture
Economics and Statistics Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Economics and Statistics Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1979-80 CROP YEAR

CENTRAL FLORIDA

The 1979-80 season was of near normal to above normal temperatures for the beginning of the season through the end of January. A period of cold weather occurred during the month of February through the first week of March, then mild weather returned until the end of the season. Rainfall for the season was near normal.

NOVEMBER: The first half of the month was mild. On the 16th and 17th following a cold front, temperatures dropped to minimums of 40's with a few 30's in the colder locations. Unseasonably warm readings then prevailed until the 28th. A major shift in the upper air pattern took place at the end of the month which allowed a strong cold front to move down the state on the 28th and 29th. Temperatures dropped into the 30's. Rainfall in the western portion of the area was less than 2 inches while the eastern part recorded 2 to 4 inches.

DECEMBER: The first day of the month was a continuation of the cold weather at the end of November. A slow moderation occurred after that until another front moved through on the 16th. Temperatures on the 18th to the 21st dropped to the upper 30's to lower 40's. Another front brought similar readings to the central area on the 26th through the 28th. Rainfall ranged from 1 to 3 inches occurring primarily as the cold fronts moved through.

JANUARY: Most readings during the month were above freezing except on the 2nd, 3rd, 6th and 7th when temperatures were in the upper 20's to low 30's. Other cold days with readings in the 40's and 30's were on the 1st, 4th, 5th, 24th and 25th. Rainfall for the month was near normal with generally 2 to 3 inches being recorded.

FEBRUARY: The first day of the month began with a cold front passing through the State, but temperatures held in the 30's due to cloud cover. The cold continued through the 7th with readings in the mid 20's to low 30's on the 2nd, 4th and 7th. Durations below 28 degrees were less than 4 hours. Cool, cloudy weather prevailed until the 26th when a strong cold front brought another low reading to the area. On the 28th and 29th temperatures dropped to the upper 20's to mid 30's. Rainfall amounts ranged from 1 to 2 inches in the northern part of the area while 2 to 3 inches were recorded in the southern portion.

MARCH: A cold front brought cloudy, rainy conditions to central Florida on the 1st and 2nd. By the 3rd skies had cleared and temperatures dropped to the mid 20's in the interior to low 30's near the coasts. This was the coldest weather of the season in many areas with wide-spread frost. Durations below 28 degrees were 4 to 8 hours in many interior locations and new growth on citrus sustained significant damage. The morning of the 4th was a few degrees warmer, but still below freezing. For the next two weeks temperatures climbed well into the 70's and low 80's with lows remaining in the 50's and 60's. The last cold night of the season came on the 23rd with readings falling into the 40's. Mild weather then returned for the remainder of the month. Rainfall for the month ranged from 1-1/2 to 3 inches.

SOUTH FLORIDA

The 1979-80 season was relatively mild, except for the period from February 1 to the first week of March. The coldest morning of the entire season didn't occur until March 3, when temperatures dropped into the mid to upper 20's in the Glades and near freezing along the Lower East Coast. Rainfall was near to a little above normal.

NOVEMBER: The 1979-80 season began with mild weather the entire month of November. Temperatures for the month averaged about 2-1/2 degrees above normal. Most daytime temperatures were in the 80's, with lows at night in the 60's. Two brief cold spells - one near mid month and the other near the end - dropped temperatures into the 40's. Rainfall amounts ranged from less than an inch at Ft. Myers and Homestead to more than 4 inches at West Palm Beach and Stuart.

DECEMBER: The month continued the relatively mild winter season, averaging about one degree above normal. While there were 12 cold nights in the Peninsula, temperatures never dropped below the 40's except at the coldest locations in South Florida. The coldest period occurred on the 26th through the 28th. Rainfall ranged from 2 inches at Clewiston and Stuart to 5 inches at Ft.Myers.

JANUARY: Temperatures were near normal with the month being a little cloudier and wetter than usual. A strong cold front dropped temperatures into the 30's to low 40's on the mornings of the 2nd and 3rd. Another cold snap occurred on the 25th. Rainfall averaged 2 to 4 inches over most of the areas.

FEBRUARY: Temperatures averaged 4 to 5 degrees below normal. There were 16 cold nights in South Florida. A cold front moved down the Peninsula on the last day of January. The first eight days of February brought lows in the 30's and 40's to South Florida. The coldest morning was the 4th, when temperatures dropped to near freezing in the Glades, and mid to upper 30's along the Lower East Coast, with some frost. Near the end of the month temperatures plunged into the mid 30's to low 40's in the Glades, while remaining in the mid to upper 40's along the coast. Rainfall was a little below normal, with most places receiving 2 to 3 inches.

MARCH: A strong cold front entered the State on the 1st. By the 3rd, the storm had intensified in the Atlantic, allowing an extremely cold high pressure system to settle over the State on the 3rd and 4th. The morning of the 3rd was the coldest, with readings in the mid to upper 20's in the Everglades, and near freezing along the Lower East Coast. Durations below 32 degrees ranged from 5 to 8 hours in the Glades to 5 hours or less along the Lower East Coast. By the 6th, daytime highs were back into the low 80's. Mild weather continued until the 23rd when the last cold night of the season occurred. Temperatures dropped into the 40's, with a few upper 30's in the coldest locations in the Glades. Most areas had 1-1/2 to 3 inches of rainfall with the driest southeast of the Lake, and the wettest in the Ft. Myers area.

1979-80 PRODUCTION SUMMARY

Florida's 1979-80 season began with bloom appearing the first of March and continuing well into April in some locations. Rainfall during the winter was adequate and trees had a good dormancy period.

Hurricane David moved up the east coast of Florida on Monday, September 3. High winds broke small limbs and blew off foliage along with varying amounts of fruit from Broward County northward to Volusia County. Rainfall was not severe enough to cause widespread grove flooding. No other growing areas were affected by the hurricane.

Temperatures remained near normal over most of the growing areas throughout the winter months except for a late season cold snap the first of March. There was isolated fruit damage in cold pockets, but no significant damage was sustained at the state level.

The initial forecast for the 1979-80 season was for 200 million boxes of oranges. This was not the largest crop ever forecast, but the 206.7 million boxes finally harvested was a record. It was 26 percent more than the 1978-79 season and 11 percent more than the previous record high 1976-77 season.

Grapefruit were forecast at 51 million boxes, only 1 million less than the previous season's production. Final production totaled 54.8 million boxes. Fresh utilization was below the previous season's usage and only 36 percent of the total crop.

FCOJ yield was forecast in October at 1.30 gallons per box and ended up at 1.33497. The FCOJ pack was 231,257,000 gallons from 173,229,000 boxes.

California's 1979-80 season production rebounded from the previous season's freeze to set a record for principal citrus fruit production. Fresh shipments were substantially higher than the previous season for oranges but slightly lower for grapefruit. Lemon production also increased from the previous season but did not quite reach the level of other recent years.

Arizona's 1979-80 production of oranges and grapefruit returned to pre-freeze levels but production of lemons was only 3,050,000 boxes, substantially less than the previous three seasons.

Texas production of oranges was off substantially from the previous seasons with fresh shipments the lowest in several seasons. Grapefruit production however, was at near normal levels.

Tree Census

The Florida Crop and Livestock Reporting Service first began indexing the state's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identified all the state's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks were measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1968 through 1980 to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three mile wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 845,283 acres of commercial citrus as of January 1980. This is a net increase of 1.7 percent from the 831,235 acres in January 1978. New citrus groves set during the calender years of 1978 and 1979 totaled 39,973 acres which more than offset the 25,925 acres lost. This is the first net increase in acreage since the 1970 survey. The net increases occurred in the East Coast and Lower Interior growing area.

In addition to enumerating total changes in grove acreage, the surveys since 1976 were designed to give more detail on acreage removals and additions. As in past surveys, the 1980 results showed that about one half of the new planted equivalent acres were resets in existing groves. Another 25 percent of the new plantings were on new land never before used for citrus. Again as in past surveys, about 17 percent of the lost acreage occurred because of commercial development with the majority of the loss (58 percent) occurring as vacancies in existing groves.

There are approximately 1,200 photography enlargements on file. These are replaced over a four-year period, approximately 600 after each flight year. Information form the old enlargements is transferred manually to the new enlargements. Work on the ninth biennial survey will begin in November, 1981.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1980, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	- -	- -
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	- 6.7	+2.3
1974	864,098	- 1.6	+ .7
1976	852,369	- 1.4	- .7
1978	831,235	- 2.5	- 3.1
1980	845,283	+1.7	- 1.5

1979-80 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all Florida citrus is a record $1,010,445,000. This is 5 percent greater than last season's revised value of $966,916,000.

Preliminary value is based only on that part of the crop that was priced at harvest, about 30 percent. When all participation plans are finalized, a revised value will be calculated.

The delivered-in price for all priced fruit (approximately 51 million boxes) going into FCOJ was $.85 per pound of solids, 13 percent less than last season's $.98 per pound.

Florida, all citrus: Value of sales, on-tree, crop years 1970-71 through 1979-80

Crop year	Value	Crop year	Value
1970-71	$315,882,000	1975-76	$ 440,326,000
1971-72	427,245,000	1976-77	529,765,000
1972-73	394,645,000	1977-78	848,680,000
1973-74	359,388,000	1978-79 1/	966,916,000
1974-75	397,066,000	1979-80 2/	1,010,445,000

1/ 1978-79 revised. 2/ 1979-80 preliminary.

COUNTY PRODUCTION

Estimates of citrus production by county were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production is obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices reported by the U.S. Department of Agriculture's Economics and Statistics Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final processing price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh Florida citrus exports to countries other than Canada and Mexico for the 1979-80 crop year accounted for 10,454,000 cartons which was the second highest volume on record. The previous season's record was 11,699,000 cartons. Grapefruit exports totaled 9,974,000 cartons in 1979-80 which was six percent under 1978-79. Oranges last season accounted for 299,000 cartons, down 71 percent from the 1979-80 movement to foreign destinations. Specialty fruit contributed 181,000 cartons to the exports volume last season and this was 19 percent greater than the previous season.

Grapefruit accounted for 95 percent of the exports movement. Japan, the largest user, received 5,983,000 cartons in 1979-80 which was 1,000,000 cartons less than 1978-79. Three factors were cited for this drop in volume. They were: (1) High prices of Japanese vegetables cut into purchases of grapefruit sales; (2) Increased transportation cost tended to make the wholesale price at destination greater than the previous year; and (3) Japanese citrus imports fluctuate up or down with the size of the mandarin crop for that country. France, the second largest, and Germany, the fourth, were up slightly in the volume of Florida grapefruit exports while most other countries were down. Oranges to Puerto Rico amounted to 217,000 cartons of the total 299,000 cartons exported last season. Japan and New Zealand, which received a substantial quantity in 1978-79 obtained none in 1979-80. Volume to the Continent was also down in 1979-80. Taiwan which recorded no exports of Florida oranges in 1978-79 accounted for 52,000 cartons in 1979-80.

Florida orange concentrate exports increased from 9.3 million gallons of 45° Brix in calendar year 1978 to 11.5 million gallons in 1979 according to Florida Citrus Processor reports. This represents a 23.7 percent increase. Canada is the largest single customer for U. S. produced orange concentrate. Expansion opportunities for export market for Florida concentrate were limited in 1979 by large supplies from Brazil.

Citrus box weights: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grapefruit	Tangerines	Lemons	Limes
Florida	90	85	95	90	80

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began Florida's dominance of the Nation's citrus became even more apparent. In 1979-80, Florida had 75.3 percent of the Nation's production.

Footnote 3/ for page 35, 1/ for page 36 1/ for page 37. Final Mexico import shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 35 thru 37 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus. Mexican shipments excludes Canadian shipments.

ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ed C. James, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Jackie Bowen, Ray Crickenberger, Joe Galant, Laura Grimsley, Kitty Hildreth, Janet Meyer, Barbara Palmer, Mable Robinson, Tommy Scherer, Pat Todd, Angeline van Loon and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

PRINCIPAL VEGETABLES BY PRODUCING AREAS

1. WEST
   - A. Escambia county - Potatoes.
   - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
   - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
   - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
   - E. Hastings - Cabbage, potatoes.
   - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
   - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
   - H. Oxford-Pedro - Tomatoes, watermelons.
   - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
   - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
   - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
   - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
   - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
   - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
   - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
   - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
   - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
   - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
   - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
   - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

▇ Commercial Vegetables ▨ Watermelons

DEFINITIONS AND EXPLANATIONS

QUARTERLY GROUPS–During the growing season, estimates were prepared for most crops on a calendar quarter basis in order to indicate available supplies for shorter periods of time than the entire crop year. The fall, winter and spring quarterly estimates are combined into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during one designated quarter. Acreage lost and replanted to the same crop in time for harvest in the same quarter, is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT–The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most common unit estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1979-80 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. net weight	No. of units per cwt.
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Green Pepper	Bushel	25	4.000
Cabbage	Crate	53	1.887	Potatoes	Sack	100	---

Lettuce	Cwt.	100	---				

SUMMARY OF THE 1979-80 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1979-80 crop year totaled $788.7 million, up $34.7 million from the 1978-79 crop year. Acreage harvested was slightly below the previous year. Crops showing the greatest gains in harvested acres were snap beans for fresh market, celery, lettuce, tomatoes, "other vegetables" and strawberries. Crops increasing in value were snap beans, sweet corn, cucumbers, eggplant, green peppers, radishes, squash, tomatoes, "other vegetables," watermelons, potatoes and strawberries. Crops with lower values than the previous year were cabbage, celery, escarole and lettuce. Most of the declines were due to lower season average prices. Tomatoes, which rose $24.0 million, showed the greatest increase in value followed by watermelons which increased $14.3 million, "other vegetables," $8.2 million, and cucumbers $8.0 million from a year ago. Cabbage and lettuce showed the greatest declines, down $30.0 million and $11.3 million, respectively, from the previous year.

Average yields for eggplant, squash, tomatoes, watermelons and strawberries increased during the year but yields declined for snap beans, cabbage, celery, sweet corn, cucumbers, escarole, lettuce, green peppers, radishes and potatoes.

Season average prices of snap beans, sweet corn, cucumbers, eggplant, green peppers, radishes, squash, "other vegetables," watermelons, potatoes and strawberries were higher than a year ago. Season average prices for cabbage, celery, escarole, lettuce and tomatoes were below a year ago.

Land preparation, planting and transplanting were very active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas in August. Planting activity progressed favorably. Rains resulting from hurricanes, cool fronts and a tropical storm slowed plantings in September. High winds damaged crops but little acreage was lost when Hurricane David moved up the east coast in early September. Planting and harvesting activities were interrupted by showers in October and November as numerous cold fronts moved across the state.

Temperatures were generally mild during most of December. Heavy rains in early December washed beds and leached fertilizer. Cold fronts in early and late December brought low temperatures in the 30's as far south as central Florida. Damage was limited. Foliage of some tender vegetables received light frostburn in the central areas and light windburn in the southern sections.

Much of January was characterized by numerous cold fronts with scattered frosts. Rainfall was mostly light and low temperatures were in the 30's and 40's during the first half of January. Temperatures were generally mild and rainfall heavier during the remainder of the month. Heavy showers and thunderstorms with up to 5 inches of rain occurred in late January. Accompanying strong winds caused minor damage to some tender crops.

Cold weather with near freezing low temperatures dominated the first part of February. Many areas established record lows in early February as cold arctic air invaded the state. Brisk winds damaged some tender foliage. A warming trend ended when a late month cold front brought freezing temperatures and frosts to central Florida.

A severe cold front in early March brought freezing temperatures over the entire Peninsula with record lows across the state. Freezing temperatures and gusty winds resulted in lost acreage and plant damage, particularly for tender crops. The remainder of March was generally mild with scattered showers and thunderstorms.

Temperatures were above normal in early April and near normal for the remainder of the month. Skies were frequently cloudy with numerous scattered showers and thunderstorms. Rainfall was generally light to moderate. Some damaging hail occurred in many areas on April 19 when a weak front moved over the state. Harvest was in full swing for some crops while others were declining seasonally.

The month of May was characterized by cloudy skies and numerous showers and thunderstorms in the central and southern vegetable growing areas. Heavy rains and very strong winds during late May caused some light to moderate plant damage in areas of southeast Florida. Daytime high temperatures were mostly in the upper 80's with nighttime lows in the 50's and 60's. Harvest was very active for some vegetables but declining for others.

Hot days and warm nights dominated the weather picture during June in the vegetable growing areas. Rainfall was light in early June. A cold front that stalled over central Florida, June 9-12, brought rains to most areas of the state. Rainfall was heaviest in the southeast with over 9 inches at Homestead. Showers and thunderstorms during the remainder of June brought moisture to most areas, but rainfall was light in the southwest. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1979-80

Florida growers produced 5.1 million bushels of bush and pole beans during the 1979-80 season for fresh and processing utilization, down 19 percent from last year. Acreage harvested for fresh and processing totaled 54,300 acres, up slightly from the 54,100 acres harvested during the previous season. The average yield for the 1979-80 season was 89 bushels per acre for fresh market and 129 bushels per acre for processing, as compared with 102 bushels and 163 bushels per acre, respectively, the previous year.

The average f.o.b. price of $8.11 per bushel for fresh market was 53 cents more than the previous year and a record high. At $2.97 per bushel, snap beans for processing are up 75 cents from last season and 49 cents above the 1977-78 season price of $2.48. Total value, at $36.7 million, was 1 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with small acreages grown in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The north and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid June. The fall crop peaked in December. Marketings declined in January and February. Production began to increase in March, and the spring crop peaked in April. Eighteen percent of the marketings occurred in April, down 3 points from April the previous year.

Variable weather influenced last year's bean crop. Hurricane David caused extensive windburn damage but very little acreage was lost. Heavy late September to late October rains in the southeast washed beds and leached fertilizer which reduced stands in newly planted fields. During the winter season, brisk, cold winds whipped plants, causing leaf damage and fruit scarring. Cold weather slowed maturity, resulting in lower volume. Weather during the spring season was generally favorable. Quality was mostly good but yields were below normal for the spring season.

CABBAGE
1979-80

Florida's cabbage growers produced 7.2 million crates and sacks during the 1979-80 season, down 15 percent from the previous season. The gross value was $21.9 million, less than half the gross value of $51.9 million received in the 1978-79 season. The average f.o.b. price was $3.05 per crate or sack, down sharply from the $6.17 received for the prior season's crop.

Total acres planted amounted to 18,600 acres, up nearly 2 percent from the 1978-79 season. Acreage harvested totaled 15,800, a decline of 11 percent from a year ago. Abandonment was higher than usual because of low prices. Yields were also down from last season, averaging 454 crates per acre, 18 crates less than a year ago.

Cabbage was available for market beginning in late November and continuing through June. Production was below normal during the fall period and the lowest since the 1969-70 season. The peak month was March, followed by April while February was close behind at third.

The Hastings area, which includes the 3 counties of Flagler, Putnam and St. Johns, continued to lead the state in production, accounting for nearly 56 percent of the state's total. St. Johns County led all other counties in acreage harvested with 28 percent of the total acres harvested in the state.

Direct seeding and transplanting was beginning in late August and early September although less acreage was planted during that period than usual. The most active month for transplanting was November followed by December. Seeded acreage was the most active during October, however, only a small portion of the total acreage planted is seeded direct in fields.

First cuttings began at the end of November. Harvest increased slowly at first, then picked up during February and March. Winter production accounted for 60 percent of the total crop, the highest for that period since the 1974-75 season. Spring production was down from the previous spring and the spring of 1978.

CARROTS
1979-80

Production of carrots in Florida continued to increase during the year. There were 1,223,000 cwt. shipped out of Florida for both fresh and processing during the 1979-80 crop year. Fresh use constituted 76 percent and processing 24 percent. This compares with 74 percent fresh and 26 percent processing the previous year. Approximately 12 percent of the fresh carrots were mini or finger carrots compared with 14 percent the previous year. The remaining 88 percent were regular type carrots. Carrots are not part of the regular statistical program in Florida, therefore, data on acreage and production are not published separately. However, data are included in "Other Vegetables."

The muck soils around Lake Apopka, near Zellwood and the Everglades provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October and is complete by the end of May. Regular size carrots are harvested from November through June. The peak harvest period last season was mid January to early May. The young carrots are subject to cold damage in January and February in the Zellwood area. Growing conditions were generally favorable. Size and quality were good throughout most of the season.

CELERY
1979-80

Florida celery marketings of 8.2 million crates were harvested from 12,200 acres during the 1979-80 growing season. The average yield of 673 crates per acre compares with 695 crates the previous year.

Prices averaged lower than the previous year and at $5.70 f.o.b. per crate, compared with $6.78 per crate during the 1978-79 season. Prices during each quarter averaged below a year earlier. The sharpest decline occurred in the winter and spring quarters. The crop was valued at $46.8 million, a decline of 15 percent from the previous crop year.

The Everglades, with 86 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area,supplemented by a light supply from the Sarasota area, accounted for the remaining 12 percent of acreage and provided a continuous supply throughout the season.

Plant bed preparation and seeding were underway by mid June. Transplantings were gaining momentum by late August and became quite active in September. Transplantings in the Everglades were winding down for the season in early April and were complete by mid April. Plantings were also complete in the north central area by early May. Growers in the Sarasota area normally plant from October to March.

Light harvest began in early November in the Zellwood area and the second week of November in the Everglades area. Growing conditions were hot and humid in the summer and early fall months. Heavy rains slowed progress in November. Cool weather in December was beneficial for growth and development. Quality was fair to good early in the season and then improved from good to very good as the season progressed. Yields and size were fair to good but generally below year earlier levels.

No significant damage occurred from cold fronts moving into vegetable growing areas. The late winter and spring markets were on the weak side. Prices averaged considerably below year earlier levels. Approximately 4 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality celery.

Celery production was most active December through May with April being the peak month. Cutting was completed in all areas by the first week of July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the committee, these data are assembled into weekly, monthly and annual reports and published in this annual report.

CHINESE CABBAGE
1979-80

Chinese cabbage is grown primarily on the mucklands of Zellwood and the Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November. Volume was light through December but increased to good supplies by January and February. Production reached a peak in February and March. Good volume was available from December to mid May. During April, Zellwood was providing good supplies while the Everglades was declining seasonally. The season was over by June 1. Quality was mostly good throughout the season. No significant cold damage occurred. Shipments for the season totaled 135,000 cwt., down 17 percent from the previous year.

SWEET CORN
1979-80

Florida, the Nation's leading sweet corn producer for fresh sales, marketed 11.2 million crates during the 1979-80 season. Production declined 8 percent from the previous year. The decline was due to both a reduction in acreage harvested and lower yields per acre. Growers harvested 51,800 acres, down 5 percent from the 54,500 acres harvested during the 1978-79 season. Yields averaged 215 crates per acre statewide compared with 222 crates per acre a year earlier. Yields have averaged above 200 crates per acre for every year since the record 244 crate average in the 1972-73 crop year.

The season average f.o.b. price of $5.03 per crate was 78 cents above the average for the previous year. The total value of the crop was $56.1 million, up $4.7 million from the $51.4 million received for the 1978-79 crop. The value of sweet corn ranked second in the state in vegetable crops and was exceeded only by the value of tomatoes.

First plantings of the season were underway in the Everglades in July. Seeding on the east coast got underway in late September. First harvest began in the Everglades in late September. Cutting continued to gain and reached a good level by November. The declining harvest in the Everglades during December was partially offset by supplies from the lower east coast and Dade County.

Harvest of the spring crop in the Everglades was underway by mid April. The Everglades became the main source of supply in late April as the east coast and Dade areas began to decline seasonally. The transition of harvest from the Everglades to Zellwood occurred in mid to late May. Lake County provided a good supply into July. The season was complete by mid July.

A small acreage provided supplemental supplies at Zellwood and the west central area during the early fall, and at Sarasota in the early spring.

Weather during most of the growing season was generally favorable, with the exception of freezing temperatures on March 3. Some acreage was lost in the Zellwood and Everglades areas. Quality and ear size improved as the season progressed and averaged mostly good for the season. The spring crop grew rapidly under favorable conditions.

CUCUMBERS
1979-80

Florida production of cucumbers for fresh market and processing utilization during the 1979-80 crop year was 5.1 million bushels, down 3 percent from the 1978-79 crop. The fresh market channel utilized 79 percent of the production and the remaining 21 percent was for processing. The 23,100 acres planted was down 200 acres from the previous year. Harvested acres totaled 21,700, down 300 acres from a year earlier. Average yield per acre for fresh market, at 280 bushels, was up 12 bushels from the previous season. Cucumbers for processing averaged 145 bushels per acre, as compared with 164 bushels last year. Total production was valued at $45.7 million compared with $37.6 million for the previous year. The f.o.b. price for 1979-80 averaged $8.67 per bushel for fresh market and $10.01 per bushel for processing, as compared with $7.61 and $5.42 per bushel, respectively, the previous year.

Supplies in 1979-80 were generally available from October through June, with light marketings January through March. Many of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 38 percent of the acreage in 1979-80, is the largest area. The west central area accounted for 33 percent of the planted acreage in the state. The west, north, north central and southeast areas provide the remaining acreage.

Weather during much of the growing season was favorable. The crop was in mostly good condition during the fall, but some young plants were damaged by rains in late September. Strong, cold winds, starting in December, slowed growth and caused leafburn damage. Freezes in February were followed by a severe freeze in early March. Damage was heavy to young plantings and the remaining fall acreage. Considerable replanting was necessary. The crop was in generally good condition during the spring despite adverse weather with hail damage to the crop in April. Fruit quality, color, size and yields were mostly good for the spring season.

EGGPLANT
1979-80

Plantings totaled 3,100 acres, the same as the 1978-79 season. Yields averaged 600 bushels per acre, 15 bushels above the previous season. Weather was generally favorable during much of the fall and spring. No acreage was lost but some spot resetting was necessary after Hurricane David. During the late fall and winter, strong winds scarred fruit and burned tender leaves. Poor market conditions caused some abandonment of older fields in November. However, harvest was resumed in some of these fields when market conditions improved during January. In early March, freezing temperatures caused foliage damage and some loss of bloom and small fruit. Crop condition was mostly good to very good in the spring after plants recovered from the March freeze. Quality, size, and yields were mostly good.

Production of eggplant increased to 1.7 million bushels, 2 percent above last year's production. Total sales increased to $7.3 million compared with $6.8 million a year earlier. The increase was due to higher yield per acre and price per bushel because harvested acres were unchanged from 1978-79. The season average price of $4.36 per bushel is 22 cents higher than a year ago. Compared with prices a year earlier, the fall crop was higher, the winter crop was unchanged, and the spring crop was lower.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November, and dropped during the winter. November volume is low compared to the past 2 years because poor market conditions resulted in abandonment of some acreage. Harvest began to increase in April and reached a peak in June. Harvest was virtually complete in July. The southeast area around Pompano accounted for 45.7 percent of the harvested acreage. The northern and central areas combined contributed 46.4 percent of acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in the western, northern, and central areas are for fall and spring harvest only. Those areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas and then moved back northward in the spring.

ESCAROLE-ENDIVE
1979-80

Production of escarole and endive during the 1979-80 season totaled 3.0 million crates, down 10 percent from a year earlier. The 6,300 acres harvested were down 200 acres from the previous season. Yield per acre averaged 481 crates compared with 515 crates the previous year.

Prices during the season averaged $3.72 per crate, compared with $4.05 a year earlier. The total value of sales, at $11.3 million, was 17 percent below the previous year.

The Everglades, which had 75 percent of the harvested acreage in the 1979-80 season, began seeding in early September. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slow in late October but increased to a good volume by November. Marketings reached peak levels in the February to April period. Harvest was completed in May.

Growing conditions were generally favorable during most of the season. However, rains during October interrupted planting and harvest activity. Some light cold damage to outer leaves occurred in early March. Quality of escarole and endive was mostly good throughout the season.

LETTUCE
1979-80

Florida lettuce growers produced a record 2.7 million cwt. during the 1979-80 season. An 8 percent increase in harvested acreage more than offset the slight decline in yield. The average yield of 193 cwt. per acre compares with 199 cwt. for the previous year. The season average f.o.b. price of $13.67 per cwt. was $5.08 below the favorable price of a year earlier. Prices were lower than the previous year for all quarters with the greatest difference in the winter quarter. Prices during the spring quarter were only slightly below the previous spring.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, 62 percent; romaine, 18 percent; Boston, 9 percent; bibb and leaf combined, 11 percent of the total acreage harvested.

The Everglades muckland accounted for 88 percent of planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in early September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid November. Volume gained considerably in December with growers cutting in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Supplies peaked in April and declined to the season's end by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the early fall were hot and humid. Heavy rains slowed field work. Growth was generally rapid. Several cold fronts slowed growth and maturity during the winter months but overall damage was light. Heavy volume was available statewide in March and April. Quality was generally good throughout the season.

PEPPERS
1979-80

Florida produced 7.2 million bushels of peppers during the 1979-80 season, a decline of 11 percent from the previous year. The average yield of 414 bushels per acre was 7 percent below the 445 bushels per acre last season. Production was from 4 percent fewer harvested acres.

The season average f.o.b. price of $7.13 per bushel was up from an average of $6.13 for the previous year. The total value of $51.0 million was 3 percent above the previous year. Prices were generally good during the fall and winter periods. Marketings were light in October but increased to a fair level by December. Supplies decreased during the winter months but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

The 6 percent decrease in total planted acreage was the result of a 16 percent drop in the heavy producing southwest area. Increases in the north central and west central areas were not enough to offset the decrease. The southwest accounted for 48 percent of the state's total pepper acreage. The southeast had 22 percent; the north central area, 13 percent; the west central area, 9 percent; and the north, 8 percent.

During September, hot weather and dampoff, plus wind damage in the Pompano area necessitated considerable replanting to improve stands. Conditions during the remainder of the fall season were generally good. Strong, cold winds during the winter months caused foliage burn to young crops. Replanting was active after the early March freeze. Spring weather conditions were generally favorable. Yields were fair to good.

POTATOES
1979-80

Production of potatoes in 1980, including both winter and spring seasons, totaled 5.3 million cwt., down 12 percent from the previous year. A total of 29,600 acres were planted, a decline of 4 percent from the 30,700 acres planted during the 1978-79 season. Of the total acreage planted, 27,300 acres were harvested, slightly over 2 percent below the year before. The value of the crop was estimated at $36 million, nearly 19 percent above the 1979 crop. The increase in value was attributed to a higher average price received for all crops with winter potatoes up sharply.

The average yield was 194 cwt. per acre, 21 cwt. below last year. The spring yields at 194 cwt. were down from last year's record of 228 cwt. In the Hastings area, which covers the three counties of Flagler, Putnam and St. Johns, the average yield was 195 cwt., down 35 cwt. per acre from the 1979 record yield of 230 cwt. Spring potatoes grown in all other locations of the state, ranging from the Ft. Myers area in the south to northern Escambia County in the Panhandle, averaged 170 cwt. per acre. The winter crop averaged 195 cwt. per acre.

The 1980 season average price for all potatoes, at $6.80 per cwt., was $1.74 more than the 1979 season. All areas received higher prices than a year ago.

Both "white" and "red" skin varieties are grown over the state. The red skin types are the dominant variety grown for winter harvest in south Florida. The bulk of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area the "white skinned" varieties are the most important. A large percentage of the crop is used in the potato chip industry. Both "whites" and "reds" are grown in the Hastings area and are sold for table stock.

The winter potato harvest was late in getting underway in 1980. Harvest got underway in late January with only one percent harvested in the month. Harvest was slow during the early months causing the season to extend into the spring months. The peak shipping month was April. Harvest of the spring crop in the Hastings area got underway during late April. Peak harvest was in May but was also very heavy during June. Abandonment in the area was slightly higher than usual due partly to a hard freeze during the early morning of March 3, 1980. In the other growing areas, digging started in April and extended into early July. There was some acreage abandoned because of the freeze in early March.

RADISHES
1979-80

In 1979-80, radish plantings amounted to 32,600 acres compared with 33,600 acres planted the previous year. Acres harvested totaled 28,400, 4 percent below the record high of 29,600 in 1978-79. Yields per acre averaged 247 cartons compared with 273 cartons the previous season. The crop was valued at $23.1 million, up $5.5 million from a year earlier. The average f.o.b. price was $3.30 per carton, up $1.12 from the previous year.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in December. The spring peak occurred in March. Seeding of the 1979-80 crop was underway in the Everglades and north central areas in early September. Plantings were slowed by early fall rains. Light harvest was underway in early October and became quite active in mid November. Supplemental supplies were available from Lake Placid and Sarasota during the year.

SPINACH FOR PROCESSING
1979-80

Spinach statistics have not been published separately for Florida in recent years in order to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetables" series shown in this publication. Data for 1973 and earlier are available upon request. Yields per harvested acre averaged near yields a year earlier. Most of the crop is grown in the north central area. Freezing temperatures in early March caused a few problems.

SQUASH
1979-80

Florida's production of squash during 1979-80 season, at 2.4 million bushels, was .5 million bushels above last year. Harvested acreage totaled 13,500 acres, an increase of 1 percent from the previous year. The yield, at 174 bushels per acre, was up 35 bushels from the previous year.

The average f.o.b. price of $9.30 per bushel was up $1.79 from last season. Total f.o.b. cash receipts amounted to nearly $22 million. Prices were generally favorable throughout the season.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with almost 27 percent of the state's harvested acreage in 1979-80, produces yellow crookneck almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring seasons.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are usually light and confined mostly to local markets. The 1979-80 season got off to a slow start. Marketings increased rapidly to a fall peak in December before showing a seasonal decline during the winter months. In mid September and early October, heavy rains delayed plantings and reduced quality, yields, and packout. During the winter months, January through March, cold temperatures and strong winds slowed growth, caused extensive foliage burn, and plant kill to both old and young crops. The weather was generally favorable during the spring quarter. Some fields were abandoned in May due to poor market conditions. Peak marketings for the season occurred in April.

STRAWBERRIES
1979-80

Florida strawberry growers produced 4.0 million flats of berries during the 1979-80 season, up 24 percent from the previous year. Harvested acreage totaling 2,500 acres increased 4 percent from the previous year. Average yield of 1,583 flats per acre increased from 1,333 flats a year earlier. The f.o.b. return per flat for the season was $7.06, up 14 cents from the previous season. The value of the crop was a record $27.9 million, up $5.8 million from the $22.2 million received a year earlier.

Laying of plastic and other field work was in full swing by late September in the important Plant City-Ruskin area. Transplantings were very active around mid October and were completed by mid November. Some replanting continued throughout November. Some scattered blooms on early plantings occurred in early December and light harvest was underway by mid December in the Plant City and Dade areas. Early harvested berries were primarily for local use and roadside stands. Picking increased and shipments got underway in January. Peak movement occurred in March. Most of the commercial harvest was completed by late April. U-Pic harvest continued active during May. Plant growth was good. Freezing temperatures in early March caused some bloom loss. For the most part, plants and fruit were protected by sprinklers. Plant recovery from the cold was very good. Yields, fruit size and quality were generally good. Warm weather in late March and early April hastened maturity. First harvest was underway in Bradford County in late March. The season was nearing completion by early May. Yields were below normal as a result of early March freeze damage.

TOMATOES
1979-80

The total value of the Florida tomato crop for fresh and processing utilization was $244.2 million, an 11 percent increase over the previous year. The value of the crop was a new record for tomatoes. The average price received for fresh tomatoes was $6.28 for a 30-pound carton, 29 cents less than a year ago; however, acreage and yield were above the previous season and accounted for the record value.

Total production of 39.8 million 30-pound carton equivalents was 14 percent above last season. The fresh market channel utilized 97 percent of the total, and the remaining 3 percent was used for processing which is a secondary utilization from the fresh market acreage. The Palmetto-Ruskin area accounted for 39.7 percent of the total fresh production; the southwest 31.4 percent; Dade County 18.3 percent and the Ft. Pierce-Pompano area 7.5 percent. The remaining 3.1 percent was produced in the west, north and north central areas.

The average yield for the state was 918 (30-pound) cartons per acre, up 101 cartons from the year before. The demand was good during the year with winter production heavier than usual. Dade County produces most of the winter tomatoes. The fall shipments peaked in December, which accounted for 15.2 percent of the total production. January was the peak month during the winter season with 12.8 percent of the year's total and the spring production peaked in May accounting for 24.2 percent of the total. Tomatoes are harvested from October to early July.

The Palmetto-Ruskin area continued to be the acreage leader with 14,000 acres harvested. The southwest area ranked second, harvesting 11,800 acres, and Dade County third, harvesting 11,400 acres. The Ft. Pierce-Pompano area had 3,500 acres harvested and the north central, north and western areas harvested the balance of 1,500 acres. The largest portion of this acreage was harvested in Gadsden County.

Tomato planting got underway in July in all areas except Dade County. Growers in Dade County began planting in mid to late August. Heavy rains and strong winds from Hurricane David in early September caused some damage. Loss was generally less than 10 percent and consisted mostly of plastic blown from beds. Weather was generally favorable throughout the remainder of the fall season. During the early winter period, strong, cold winds caused some leafburn and bloom drop. Below normal temperatures prevailed during February but damage was relatively light. On the morning of March 3rd, frost and freezing temperatures caused some damage to plants and fruit. The cold was of short duration and recovery was very good. There was damage in several areas from scattered hail during April. Damage was limited to a few fields. Harvest was complete in the south by the end of May but continued active into July in the Palmetto-Ruskin area, Gadsden County and other central and northern areas.

WATERMELONS
1979-80

Watermelon acreage planted during the 1979-80 season totaled 45,000 acres -- 10 percent less than the 1978-79 growing period. Of the total acres planted 42,000 acres were picked at least one time. This was 1 percent less than a year ago. The crop of nearly 7.9 million cwt. was 22 percent above the 1978-79 season. The average yields varied by areas, ranging from 140 cwt. in the Panhandle to 215 cwt. in the south. The state average was 185 cwt. tying the previous record of 185 cwt. set during the 1974-75 season.

The average price received was a record 5.92 cents per pound, nearly 1 cent above a year ago. Prices received by growers for their melons were the highest in the south where they averaged over 7 cents per pound. The value of the crop was a record $46.5 million, $11.4 million over the previous record set in the 1974-75 season.

The watermelon harvest usually begins in the Immokalee area in April but for the fourth consecutive season, harvest was late getting started because of cold weather during the late winter or early spring. However, there is a very small acreage grown in the fall in the south and harvested during November through early January, depending on weather conditions. This small acreage is included in the total for the spring season. The harvest season progresses northward into the central areas during May, the northern areas in June, and comes to an end in the Panhandle by mid to late July. June continues to be the heaviest shipping month.

First plantings were made in the Immokalee area during late December. Cold weather during early March damaged the crop in the south and killed most of the young plants in the west central areas requiring extensive replanting and spot replanting. Fields that were set back by the cold made good recovery.

Harvest was heavy in central and northern areas during June. By late June dry weather was hurting the crop in the north and Panhandle. The dry conditions were a major factor in the heavy abandonment in the Panhandle. Demand continued good into July. The season was complete by the end of July.

OTHER CROPS
1979-80

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular statistical program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower continues to expand in the Zellwood, Hillsborough-Manatee and Everglades areas. Supplies are available from December through April. At the present time statistics are not available for publication. However, if this crop continues to grow, it may become part of the regular statistical program in the future. Shipment information is being recorded by the Market News Service. In the 1979-80 season there were 86 thousand cwt. shipped out-of-state, compared with only 65 thousand cwt. shipped out the previous season. This converts to 391 thousand 22-pound cartons.

Sub-tropical vegetable production increased from the previous year due primarily to improved yields. Improved fertilization, spray programs and better growing weather contributed to the good yields. Acreage harvested was up only slightly from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Sub-tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for the various vegetables are shown in parenthesis. The crops consist primarily of boniatos-ipomea batatos (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma sagitaefolium (dasheen, yautias); and yuca-monihot esculenta (sweet cassava). The boniato, calabaza and malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 10,600 acres of sub-tropical vegetables planted in the 1979 calendar year. Peak production of the malanga occurs in February through April. Efforts are now underway to even out the supply throughout the year. Available crop land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabazas are being brought in from Colombia, South America to select those which do best in south Florida. Cassavas (yucca) show a lot of potential as a producer of ethanol to use in gasahol as well as a fresh market vegetable. Flaking and freezing processes are being researched for boniato, cassava and malanga. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around the large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 112 thousand cwt. during the 1979-80 season, down from the 141 thousand cwt. for the previous season.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central areas. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state market, show 21 thousand cwt. for fresh market during the 1979-80 season.

Watercress is available the year round. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially the Sanford Market.

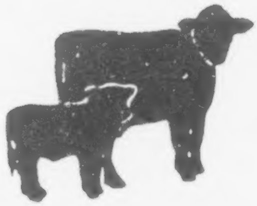
Florida Agricultural Statistics



Livestock Summary 1980

BEST COPY AVAILABLE

FLORIDA CROP AND LIVESTOCK REPORTING SERVICE
1222 Woodward Street, Orlando, Florida 32803

Doyle Conner
Commissioner

THE STATE OF FLORIDA
DEPARTMENT OF AGRICULTURE
THE CAPITOL
TALLAHASSEE
32304

Dear Friend:

The Florida livestock industry has a very significant place in the State's agricultural economy. Florida ranks first among all states east of the Missippi River, and ninth among all states in number of beef cows. Cattle are present commercially in every region of the State and represent the most widely distributed agricultural enterprise in Florida.

It is hoped that you will find this publication helpful in providing some basic statistics for the production, marketing, policy and other business decisions which you make.

The basic data for this publication was supplied by voluntary reporters from the livestock industry and compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Economics and Statistics Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

CATTLE AND CALVES ON FARMS

Florida's January 1, 1981 inventory of all cattle and calves, including both beef and dairy animals, totaled 2,480,000 head. This was 180,000 head more than a year earlier and represents an 8 percent increase. On January 1, 1981, cows and heifers that have calved totaled 1,520,000 head, up 12 percent. Beef cows increased 160,000 from the previous year and milk cows were up by 3,000 head.

Florida ranked 15th in the nation in total cattle and calves, 9th in beef cow numbers and 17th in milk cow numbers on January 1, 1981. Over 555,000 cattle and calves were shipped out of Florida during 1980.

CASH RECEIPTS

Cash receipts from Florida's cattle and calves marketed in 1980 totaled $347,706,000, down 18 percent from 1979. Total pounds marketed were down 3 percent from last year coupled with lower prices received. Cattle prices in 1980 averaged $59.90 per cwt., down $5.60 per cwt. from last year. Calf prices averaged $76.70 per cwt. compared to $95.30 in 1979.

Receipts from hog marketings totaled $53,076,000 in 1980, a 2 percent increase from 1979. Prices received for hogs averaged $37.00 per cwt., $3.60 less than in 1979 but pounds marketed in 1980 were 12 percent over last year.

HOGS ON FARMS

The December 1, 1980 hog inventory in Florida totaled 370,000 head, down 13 percent from a year earlier. On December 1, 1980, there were 64,520,000 hogs and pigs in the United States, a decrease of 4 percent from December 1, 1979.

BEES AND HONEY

Florida's 1980 honey production of 20,300,000 pounds was down 28 percent from last year and was valued at $10,556,000. The peak number of colonies in production totaled 350,000, down 10,000 from 1979. Florida ranks second in the nation in honey production and number of colonies. Producers received an average of 52.0 cents per pound for all grades and types, 0.8 cent less than in 1979. Beeswax brought an average of $1.82 per pound, up 12 cents from last year.

SURVEY METHODOLOGY

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry producion.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published August 1981

POULTRY AND EGG SUMMARY

Florida poultrymen received 214.2 million dollars from broilers, eggs and other poultry products in 1980. This is slightly above the 1979 cash receipts of 213.2 million dollars. Receipts from commercial sales of eggs, at 117.0 million dollars were down 10 percent. Producers of broilers received 94.1 million dollars, 20 percent more than 1979. Cash receipts for other poultry products amounted to 3.0 million dollars compared with 4.5 million dollars in 1979.

In 1980, eggs returned producers an average of 46.2 cents per dozen, down 2.8 cents from the previous year. Broiler prices average 27.0 cents per pound, liveweight basis, compared with 25.0 cents in 1979.

The annual average number of Florida layers declined in 1972 and 1973 after 15 years of steady growth. Numbers remained stable for the next few years then started upward in 1976. In 1980, layers at 12,813,000, dropped 2 percent from the 1979 record high of 13,049,000.

The daily rate of lay per 100 layers in 1980 was 64.9, 3 percent less than a year earlier. Egg production in 1980 was 3,044 million eggs. This was 5 percent below the previous 1979 record but up 3 percent from 1978.

During 1980, commercial hatcheries produced 151.0 million straight run chicks. Broiler-type chicks, at 110.6 million, accounted for 73 percent of the total, with egg type chicks making up the remaining portion. Broiler-type chicks hatched were up 6 percent from 1979. Egg-type hatch, at 40.4 million, was up 4 percent.

TERMS AND DEFINITIONS

MARKETING YEAR–Poultry production, price and value statistics since 1970, are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7 - 8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY–Monthly estimates of hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Monthly estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees. The table below shows the stratification of the universe established by the annual survey of December 1980 and the number of units in the sample selected for the monthly survey in the first half of 1981.

NUMBER OF MANAGEMENT UNITS IN THE UNIVERSE, DECEMBER 1980, AND SAMPLE, 1981

STRATUM	STRATUM BOUNDARIES		NUMBER OF UNITS	
	LOWER	UPPER	UNIVERSE DEC. 1, 1980	SAMPLE DEC. 1980-JUN 1981
1	400	2,999	4	1
2	3,000	19,999	15	8
3	20,000	49,999	19	11
4	50,000	99,999	4	2
5	100,000 +		21	21
TOTAL			63	43

ON PAGE 7 OF THIS PUBLICATION THE NUMBER OF HENS AND PULLETS OF LAYING AGE AND PULLETS LESS THAN LAYING AGE ARE TABULATED BY SIZE OF MANAGEMENT UNIT.

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Station and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, USDA, Florida Department of Agriculture; and Agricultural Experiment Station, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1980 FIELD CROPS SEASON

INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production and value of production for all major field crops grown in Florida. The period covered for these crops is from 1970 through 1980. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1979 and 1980. The complete series of crop estimates dating back to 1919 for the State are available upon request.

Crop estimates are designed to aid Florida farmers, bankers, credit organizations, transportation officials, research workers and others in agriculture, keep abreast of changes and appraise the current and future needs in the light of past experiences. These estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

SUMMARY 1980 SEASON

Temperatures during January and February averaged below normal while the average for March and April was well above normal. Rainfall in these early months was ample and soil moisture was adequate for planting early spring crops. Dry conditions developed during the late spring and early summer months and continued, with only brief periods of relief, through most of the remaining months of the year. The dry weather reduced yields and caused a slightly higher abandonment of many field crops. Harvest of early planted crops was underway by early summer. Harvest made good progress during the summer and early fall months. By late fall most crops except sugarcane and late planted soybeans had been harvested. The year 1980 was generally considered poor with lower yields for corn, peanuts, soybeans and tobacco than the year before.

Total acreage planted to corn in 1980 was 410,000 acres, up two percent from a year earlier. The acreage harvested for grain totaled 328,000 acres, down three percent from the year before. The average yield was 47 bushels per acre, down six bushels from 1979. Farmers received an average of $3.40 per bushel for corn sold, 55 cents more than the year before. The value of corn produced is placed at $52,414,000, up two percent from 1979.

The total area planted to soybeans was a record 475,000 acres in 1980 and was the largest acreage planted to a field crop in the State. There were 460,000 acres harvested for beans, nearly two percent more than 1979. The yields averaged 22.0 bushels per acre, well under the 29.0 bushel average of 1979. The average price received was $7.90 per bushel, up a $1.30 from the $6.60 received for the 1979 crop. Total value of the soybean crop is placed at $79,948,000, down eight percent from the year before. Soybeans rank second only to sugarcane as the State's most valuable field crop.

The total area of sugarcane harvested for sugar and seed was estimated at 339,200 acres, nearly three percent more than was harvested in the 1979-80 season. Of this total, 320,700 acres were harvested for use in making sugar while the remaining 18,500 acres were used for seed for replanting or planting new acreage. Average yield for the season was 31.2 tons per acre, just slightly below a year ago. Total cane harvested, including that used for seed, was 10,592,000 tons, two percent above the previous year. The value of the 1980 crop will not be available until a later date. The 1979 value of production for sugarcane used for sugar and seed was $314,726,000, averaging $30.30 per ton.

Production of all hay totaled 552,000 tons, down 11 percent from 1979 when 619,000 tons were produced. Hay, including all types, was harvested from 240,000 acres, 11 percent less than the 269,000 acres harvested the year before. The average yield was 2.30 tons per acre, the same as the last two years. Growers selling hay received $64.00 per ton, up from $60.00 per ton received in 1979. The total value of all hay produced was $35,328,000, a decrease of 5 percent from the year before.

There were 65,000 acres of peanuts planted in the State in 1980. Of this total, 55,000 acres were harvested for dry peanuts. The remaining 10,000 acres were harvested for green peanuts, used primarily for boiling, and all other purposes. The 55,000 acres harvested for dry peanuts had an average yield of only 2,600 pounds per acre, the lowest yield since 1972. The average price received for peanuts in 1980 was 22.0 cents per pound, up slightly from the 21.1 cents received in 1979. The value of dry peanuts produced was $31,460,000, a decline of 17 percent from the $37,948,000 in the preceeding year.

Production of flue cured tobacco totaled 20,343,000 pounds, down 12 percent from the 23,175,000 pounds produced in 1979. There were 10,300 acres harvested, the same as the year before. The average yield was 1,975 pounds per acre, 275 pounds less than 1979. The State's tobacco crop was valued at $29,497,000, a drop of six percent from the year before. The average price received for all grades was $1.45 per pound, up 10.0 cents from 1979.

The total area planted to cotton in 1980 was 6,000 acres, up sharply from the 3,400 acres planted the year before. Of this total, 5,900 acres were harvested. In 1980 the average yield was 610 pounds of lint per acre, 45 pounds more than 1979. Total production was 7,500-480-lb. net weight bales. The average price per pound of lint was estimated to be 85.0 cents, up 20.0 cents from the year before. The cotton crop was valued at $3,060,000 compared to $1,248,000 a year earlier.

Utilized production of all pecans in Florida totaled 6,000,000 pounds, more than double the 1979 crop and 43 percent more than the 1978 crop. Of this total, 2,500,000 pounds were improved varieties and 3,500,000 pounds were native or seedling varieties. The average price of all pecans was 66.3 cents per pound. The improved varieties brought 75.0 cents per pound while the native or seedling varieties averaged 60.0 cents per pound. The value of the pecan crop was placed at $3,975,000, over two and one-half times larger than the year before and 68 percent more than the 1978 crop.

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing and provide them with an orderly market.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price by removing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, business men, transportation agencies, crop and livestock interests, and governmental agencies.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Dairy Farm Inspection, Division of Dairy Industry. Shipment data are from the Road Guard Bureau, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1981, cows kept for milk production on Florida farms and commercial dairies numbered 187,000 head, 3,000 more than a year earlier. Milk cow replacement heifers, 500 pounds and over, on hand January 1, 1981, totaled 39,000 head, 11 percent more than last year. The combined total of milk cows and replacement heifers, 500 pounds and over, was 226,000 head, 3 percent more than January 1, 1980.

Florida dairies produced 2,028 million pounds of milk in 1980. Production was 2 percent above the previous year. Production per cow averaged 10,845 pounds in 1980 which was 228 pounds more than the 1979 average.

Cash receipts from marketings of Florida milk in 1980 totaled $317,422,000, an increase of 11 percent from 1979. Milk marketed by producers averaged $15.80 per hundredweight in 1980 compared to $14.50 in 1979.

The long time downward trend in milk cow numbers in the United States was reversed during 1980. By January 1, 1981 total milk cows had increased to 10.9 million, slightly above a year earlier. The combined number of milk cows and milk replacement heifers of 500 pounds or more reached 15.2 million, 2 percent above the previous year.

Annual milk production per cow in the United States averaged 11,875 pounds in 1980, up 387 pounds from 1979. There were 128.4 billion pounds of milk produced in 1980, a 4 percent gain from the previous year and 1 percent above the record 1964 output of 127.0 billion pounds.

Farmers' cash receipts from marketings of milk in 1980 were a record high $16,577 million for the Nation, 13 percent more than the previous record of $14,650 million in 1979.
